PART 01

INTRODUCTION

Understanding the Problem

1.1

Understanding the Problem

- About 15 years ago log files were simple and human readable
- Now, log files extends upto GigaBytes while selections containing the word 'error' is about 200 -300 MegaBytes
- Typically, log files can contain millions of lines per working day, making manual analysis impractical and error-prone.
- QA Engineers nightmare ...

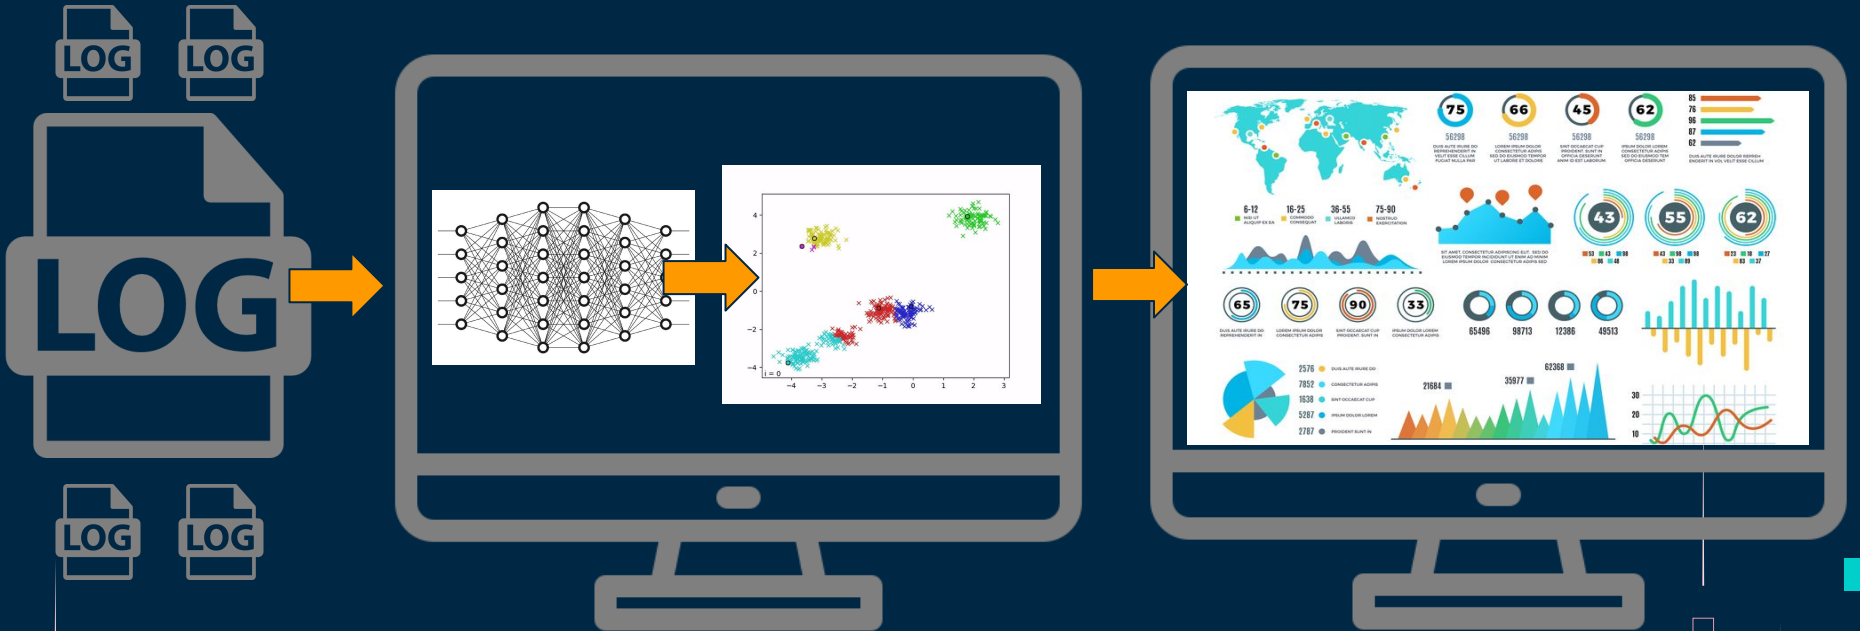

Solution

1.2

Solution

- To develop machine learning models for anomaly detection and issue identification in system traces (in form of log files)
- To visualize the system traces using interactive dashboards to provide a human understanding of what is happening in the system
- To evaluate the effectiveness of the proposed approach on real-world FinTech applications

Solution

System Architecture

Multithreading

- Concurrent handling of requests and ML computations for faster data evaluation.
- Optimal utilization of system resources like CPU cores for improved performance.
- Easy expansion to handle increased data load by distributing tasks efficiently.

Testing

- **Unit tests for the backend API's**
- **Regression testing for changes and updates in the code**
- **Integration testing to ensure dataflow from frontend to backend to ML model.**

PART 02

DEMONSTRATION

The background is a dark blue field decorated with a pattern of small squares and thin vertical lines. The squares are in three colors: light blue, pink, and orange. Some squares are solid, while others are hollow. The vertical lines are thin and white, extending from the top or bottom of the frame. The text 'THANK YOU!' is centered in the middle of the image.

THANK YOU!
